```

8" easier we can multiply by 2 and subtract 10%, but it only works for °C to °F: Example: Convert 20° Celsius (A nice day) to Fahrenheit  $20 \times 2 = 40$  less 10% is  $40 - 4 = 36$   $36 + 32 = 68^\circ$  F Add 40, Multiply, Subtract 40 Since both scales cross at  $-40^\circ$  ( $-40^\circ$  C equals  $-40^\circ$  F) we can: Fahrenheit to Celsius: Add 40, multiply by 5/9, then subtract 40 Example: Convert 10° Celsius (A cool day) to Fahrenheit  $10 + 40 = 50$   $50 \times 9/5 = 90$   $90 - 40 = 50^\circ$  F To remember 9/5 for °C to °F think "F is greater than C, so there are more °F than °C" Quick, but Not Accurate Fahrenheit to Celsius: Subtract 30, then halve Footnote: Temperature is a measure of how fast an objects particles are moving.
